DETAILED ACTION

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be

The application has been amended as follows:

 In claim 43 (line 5), "multiplication register, a plurality of additional registers" has been changed to -- multiplication register, and a plurality of additional registers --.

Allowable Subject Matter

Claims 1-22 and 26-49 are allowed. The following is an examiner's statement of reasons for allowance:

Regarding claims 1-6 and 8-22, independent claim 1 teaches a solid state imager arrangement comprising an image area, an output register which receives signal charge from the image area, a separate multiplication register into which signal charge from the output register is transferred, means for obtaining signal charge multiplication by transferring the charge through a sufficiently high field in elements of the multiplication register, and an additional register into which excess signal charge is transferred, wherein excess signal charge is transferred to the additional register

Art Unit: 2622

via one or more elements of the multiplication register, which is neither taught or an obvious variation of the relevant prior art.

Regarding claim 7, the relevant prior art fails to teach or reasonably suggest a solid state imager arrangement comprising an image area, an output register which receives signal charge from the image area, a separate multiplication register into which signal charge from the output register is transferred, means for obtaining signal charge multiplication by transferring the charge through a sufficiently high field in elements of the multiplication register, and an additional register into which excess signal charge is transferred wherein excess signal charge is transferred to the additional register via one or more elements of the multiplication register, wherein signal charge from the output register is applied to a separator which separates the excess signal charge from remaining signal charge, the excess charge being transferred to the additional register and the remaining signal charge to the multiplication register.

Regarding claims 26-34, independent claim 26 teaches a solid state imager arrangement comprising an image area, an output register which receives signal charge from the image area, a separate multiplication register into which signal charge from the output register is transferred, means for obtaining signal charge multiplication by transferring the charge through a sufficiently high field in elements of the multiplication register, and an additional register into which excess signal charge is transferred, wherein the amount of excess charge transferred to the additional register is determined

Art Unit: 2622

by implanted barrier means, the barrier means is located between the multiplication register and the additional register, which is neither taught or an obvious variation of the relevant prior art.

Regarding claims 35-42, independent claim 35 teaches a solid state imager arrangement comprising an image area, an output register which receives signal charge from the image area, a separate multiplication register into which signal charge from the output register is transferred, means for obtaining signal charge multiplication by transferring the charge through a sufficiently high field in elements of the multiplication register, and an additional register into which excess signal charge is transferred, wherein signal charge multiplication is obtained in the additional register, which is neither taught or an obvious variation of the relevant prior art.

Regarding claims 43-49, independent claim 43 teaches a solid state imager arrangement comprising an image area, an output register which receives signal charge from the image area, a separate multiplication register into which signal charge from the output register is transferred, means for obtaining signal charge multiplication by transferring the charge through a sufficiently high field in elements of the multiplication register, and a plurality of additional registers associated with the multiplication register into which excess signal charge is transferred, which is neither taught or an obvious variation of the relevant prior art.

Application/Control Number: 10/734,597 Page 5

Art Unit: 2622

Claims 23-25 were previously allowed, and an examiner's statement of reasons for allowance can be found in the previous Office action mailed on 10/26/2007.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- Hynecek (US Application Publication No. 2002/0191093) discloses a CCD device comprising CCD register wherein charge multiplication is performed.
- Hynecek (US Application Publication No. 2002/0126213) discloses a solid-state image sensor comprising a readout architecture incorporating charge multiplier cells into a horizontal register of a CCD image sensor.
- Hakamata et al. (US Application Publication No. 2003/0035057) disclose a CCD image sensor wherein the signal charge from the image area is multiplied by a charge multiplier.
- Burt et al. (US Patent No. 6,444,968) disclose a CCD imager comprising a an output register and a multiplication register.
- Hirose (JP Application Publication No. 03-252123) discloses a CCD image sensor comprising a charge-multiplying CCD connected to the final charge transfer stage.
- Sendai et al. (JP Application Publication No. 2002-325720) disclose a CCD image sensor comprising a charge multiplication path.
